(54) Facial sauna apparatus

(57) A facial sauna apparatus which is controlled by an electronic controller to drive a water heater to boil the water in a water container so that the hot water vapor can be provided for steaming the facial skin through a nozzle. An ultrasonic vibrator vibrates the water to provide cool water vapor for mixing with the hot water vapor for moistening the facial skin. The ultrasonic vibrator can be operated independently to produce cool water vapor for spraying on the facial skin through the nozzle. The water container includes a control block having a perforated hollow neck portion with a float bowl received therein, which float bowl will block up the water inlet when the water container is filled up with water. The nozzle has a horn-like structure which can effectively retain the water in the vapor ejected therethrough.

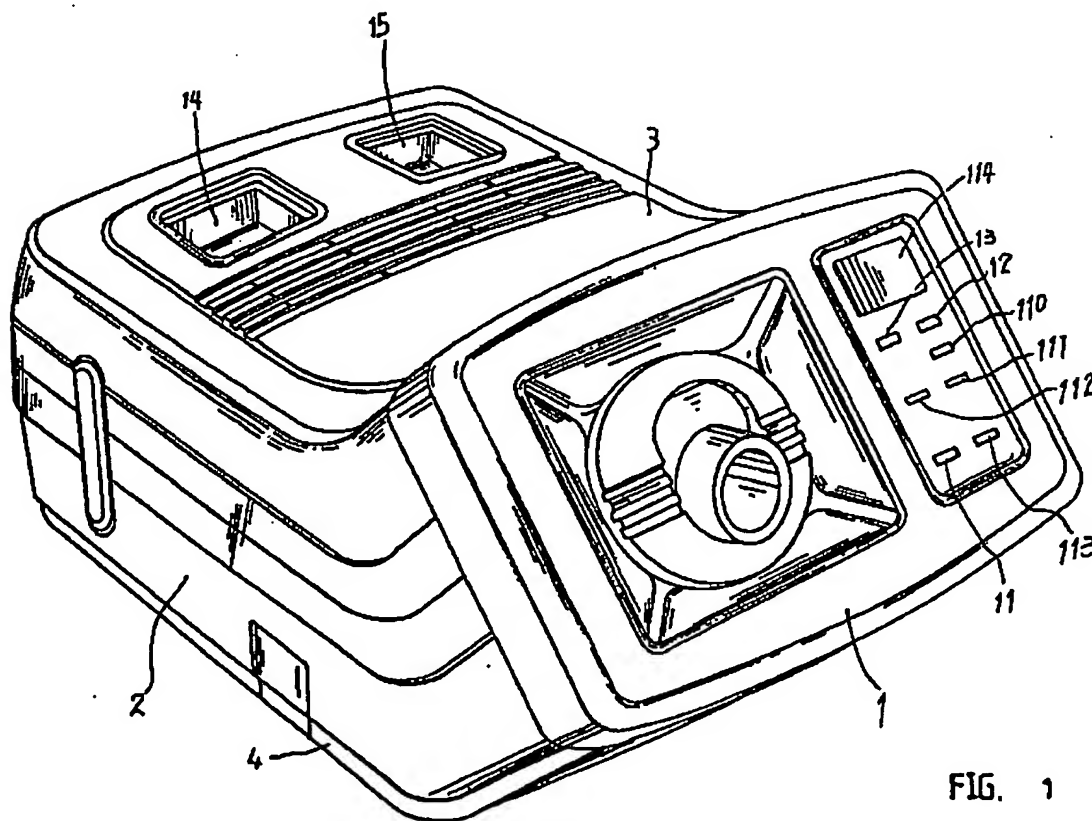

FIG. 1
